1. Introduction

1.1 Systems Function

With the, in general use, Global Positioning System (GPS) it is possible to determine a geographical position. The commonly used standard GPS provides an accuracy of approx. 10 m.

With the help of additional equipment and under certain area conditions it is possible to achieve a geographic position with an accuracy of up to ±30 cm.

1.2 Container Tracking

The temporary storage of containers by use of visual means with manual confirmation leads to an error rate in the storage handling which disrupts the efficient turn over time of the container ships so that therefore it is better to use GPS to control the positioning and documentation of containers within the container port environment.

It has been possible for years for Rubber Tired Gantry Cranes (RTG), working on container transport within a seaport, to communicate with the controlling container management system, via a data Radio Transceiver, when it picks up or sets down a container at a predesignated position within the container yard. This takes some of the load off of the driver as well as reduce the error rate, which a complicated and time exhaustive container search entails.

1.3 DGPS Positioning

![DGPS structure](image)

**Figure 1** DGPS structure
This accuracy is not enough for the presented system. Therefore alongside the GPS system fitted to the crane (mobile unit) a further stationary GPS system (reference station) is set up. The position of the reference station can be exactly calculated. So it can compare its actual position with the current position identified by the satellite signal and transmits this error factor via a wireless data transceiver to the mobile units. These can then calculate their positions with an accuracy of up to ±30 cm (differential GPS; DGPS).

1.4 Preconditions for Operation

It is essential to pay attention to the fact that obstacles, that are higher than the horizon of the GPS antennas, may generally have a bad influence on the satellite reception. As a result of these shadings and/or reflections, the accuracy of the GPS may decrease. Even a total breakdown of the GPS might be possible. Therefore it is advisable, to include the Götting KG already in the project planning phase.
2 Mounting / Cabling

2.1 Components

The device is to be mounted onto a 35 mm top hat rail according to EN50022.

Figure 2  Overview of Components
2.2 Cabling

- **Pos. 1 (HW Cab00055):**
  RG58, 2 m completely manufactured with TNC assembly socket (straight) and N socket (straight)

- **Pos. 2 (HW Cab00042):**
  RG58, 0.5 m TNC connector (straight) and N socket (straight), attached to the GPS antenna and sealed with heat shrink

- **Pos. 3 + 4 (2x HW Cab00079):**
  ECOFLEX10, project specific length one side with mounted N connector (straight) and one N connector (straight) for on site installation

- **Pos. 5 + 6 (2x HW Cab00042):**
  RG58, 2 m completely manufactured with TNC connector (straight) and N socket (straight)

- **Pos. 7 (HW Cab00091):**
  Project specific cable supplied by Götting within scope of Radio Modem

- **Pos. 8 (not within scope of supply):**
  2 x 0.75 mm² onto Phoenix terminal
  Cable for 24 V power supply between UPS and HG 61430
3 Hardware

3.1 Control Unit HG 61430-A

3.1.1 Operating Elements
- Membrane keyboard with 22 keys
- Slot for SD Card

3.1.2 Display Elements
- 320x240 pixel graphic enabled LED backlight

3.2 Antennas

- The GPS antennas should
  - be installed on top of the RTG
  - be mounted at the highest point of the crane, above all obstacles
  - be separated as far apart as possible

- The RF antenna
  - should be fixed at the highest possible point on the RTG
  - should not tower above the GPS-antennas
  - requires a free line-of-sight in all directions
Figure 26  Dimensions, mounting brackets and picture of the Trimble GPS antenna
4 Basic Definitions

4.1 Determining important values for the crane

Figure 27 Basic Operational Parameters

Figure 27 shows the values that the system needs to know in order to calculate the geometrical centre point of the crane.

4.2 Determining important values for a block

When defining a block or route which a crane should take, the following values are important:

Figure 28 Block Parameters

P1 is the starting point of the crane in this block. Via Y_min and Y_max the system is informed about the sideward expansion of the block. P2 is the end point of the crane in this block. The connection between P1 and P2 indicates the direction of the blocks. It is automatically calculated for every block how much it is rotated towards the base coordinate system.'
Figure 29  The three block coordinates Stack, Row and Tier
5 Parameter Setting

NOTE! Only especially trained personnel should alter system settings since wrong values can lead to restricted system functionality or even system failure!

5.1 Service Interface

The service interface is used for setting the parameters and the further system analysis. To do so, connect a terminal with ANSI emulation to the serial interface. The interface parameters are preset at: No parity, 8 data bits and 1 stop bit. It is possible to select difference transmission rates. Please select 115,200 baud.

It is possible to re-output the current display setting by pressing the space key. The password for protected areas is: 3141.

5.1.1 Main Menu

Following the system start-up, the main menu is displayed. From this point, it is possible to enter the different functions.

<table>

5.1.5 Parameter Interface

Set the interface parameters.

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>set the HG 614300 display contrast values</td>
</tr>
</tbody>
</table>
| 1     | sets the baud rate of the terminal interface. This change becomes active upon the next switch-on of the unit. In case the baud rate is not known upon connection of the PC, it is possible to read it out of the LCD display of the HG 61430. Other interface settings: 8 data bits, no parity, 1 stop bit, no flow control. It is possible to select one of the following values:  
  - 9600 bd  
  - 19200 bd  
  - 38400 bd  
  - 57600 bd  
  - 115200 bd |
| 2     | provides the protocol of the RS 232 interface (SIO2) to the superior computer. The following protocol is available:  
  - Teklogix |
| 3     | provides the transmission rate (baud rate) of the RS 232 interface (SIO2) to the superior computer. The following options are available:  
  - 9600 bd  
  - 19200 bd  
  - 38400 bd  
  - 57600 bd  
  - 115200 bd |

Figure 34  Screenshot: Menu Parameter Main
### Parameter Setting

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
</table>
| 4     | provides the features of the RS 232 interface (SIO2) to the superior computer. The following options are available:  
- 8,N,1 -> 8 data bits, no parity, 1 stop bit  
- 8,E,1 -> 8 data bits, even parity, 1 stop bit  
- 8,O,1 -> 8 data bits, uneven parity, 1 stop bit  
- 8,N,2 -> 8 data bits, no parity, 2 stop bits  
- 8,E,2 -> 8 data bits, even parity, 2 stop bits  
- 8,O,2 -> 8 data bits, uneven parity, 2 stop bits |
| 5     | provides the configuration of the RS 232 interface (SIO3) for the connected components. Following options are available:  
- disabled  
- Vector Heading |
| 6     | provides the transmission rate for the CAN interface 1. The following options are available:  
- 50 Kbit/s  
- 125 Kbit/s  
- 250 Kbit/s  
- 500 Kbit/s  
- 1 Mbit/s |
| 7     | provides the configuration for the CAN interface 1. The following options are available:  
- disabled  
- CFG 1 |
| 8     | enables or disables the Profibus interface |
| 9     | Input of Profibus address: 0 to 126 |
| A     | the Ethernet interface is not yet included in the software and it is therefore not possible to set any parameters. |
| F3    | internally, a direct connection between the RF modem and the connector PROG, that is accessible externally, is created (LCD only) |

Table 28  Options in Menu Parameter Main (part 2 of 2)
5.1.6 Parameter GPS

Set the GPS parameters.

**Description**

- **Input 1**: Vehicle number

- **Input 2**: Vehicle type
  
  The type of vehicle indicates, which vehicle models are used for the position calculation. Currently the following vehicle models are available:
  
  - RTG

- **Input 3**: X offset of the GPS antenna (direction of travel)

- **Input 4**: Y offset of the GPS antenna (crosswise to direction of travel)

- **Input 5**: Minimum accuracy of the GPS system

- **Input 6**: The Lock-in range defines the range of tolerance (+/- the value entered) for the measured GPS position compared to the mapped position.

  This can be set for blocks, rows, stacks and tiers.

---

**Table 29** Options of the menu Parameter GPS
5.1.7 Set Blocks

In this menu, the block coordinate systems are set.

### Terminal (PC)

![Screenshot: Menu Set Blocks]

#### Table 30 Options of menu Set Blocks (part 1 of 2)

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![image](select existing block)</td>
<td>select an existing block</td>

<td>accept X and Y-coordinate of P2 of the block shown under I from current, averaged position</td>
</tr>
<tr>
<td>![image](create new block)</td>
<td>create new block</td>
</tr>
</tbody>
</table>
In case more than one RTG is to be commissioned, it is advisable to transfer the parameters determined for the first crane to all following cranes. This way, the crane parameters as well as the block parameters are transferred to the other cranes and it is not necessary to map the terminal again with each crane.

5.1.8 Set Rows

In this menu, the row coordinates inside a block are set.

NOTE! Before altering these values the desired block has to be chosen in the menu Set Blocks, see section 5.1.7 on page 33.
5.1.9 Set Stack

In this menu, the stack coordinates inside a row are set.

NOTE! Before altering these values the desired block has to be chosen in the menu Set Blocks, see section 5.1.7 on page 33.
5.1.10 Set Tiers

In this menu, the tier coordinates are set.

</tr>
</tbody>
</table>

Table 33 Options of menu Set Rows
Figure 40  Screenshot: Parameter Update

When the menu shown above appears, the submenu send file must be selected from the Hyperterm section DATA TRANSMISSION. It is necessary to set X Modem (not 1K X Modem) as protocol. Select the file to be transmitted and press the button Send. This action starts the data transfer.
5.1.13 Download Settings (HG61430 → PC)

This menu enables downloading parameter files from the Control Unit HG 61430 to the PC.

Terminal (PC)

![Screenshot: Parameter Download](image)

When the menu shown above appears, the submenu receive file must be selected from the Hyperterm section DATA TRANSMISSION. It is necessary to set X Modem (not 1K X Modem) as protocol. Then press the receive button, assign a name to the file, e.g. crane_1.par and start the data transfer.

5.1.14 Configure Logging

The logging function is a tool for trouble shooting. It is possible to log data from the Control Unit HG 61430 during operation and send them by e-mail to Götting KG. As it is not possible to log all data via the serial interface within a 100 ms pattern, it is necessary to select data that may be relevant.
Figure 42  Screenshot: Menu Configure Logging

The menu shown above enables selecting groups of data via keys. All groups marked with a 1 are recorded. E. g. when pressing 2, the group GPS Pos would be unmarked. This means, there would be a 0. The second hit of 2 results in the selection of the group GPS Pos and thus it will again be included in the log file.

An alternative method is to edit the Log mask with the key 3. Usually a Götting engineer would give you a matching log mask. Setting a log mask means, that all relevant entries would be set in a single step.
5.1.15 Start Logging

This menu enables recording data during operation, either for troubleshooting or for simple documentation.

---

Terminal (PC)

![Screenshot: Start Logging](image)

Figure 43 Screenshot: Start Logging

Once the above shown menu appears, it is necessary to start the recording with the submenu Data Transmission - record text file in Hyperterm. Then press the space key.

**NOTE!** If the sequence of these actions is altered, meaning that the space key is pressed first and then the recording started, the headlines are lost and therefore the allocation of the data and columns is lost!
5.2 Trimble GPS Receiver

The following screenshots show how configuration files delivered by Götting are imported into the GPS receiver.

NOTE! This configuration must not be altered!

Figure 44 Screenshot: Configuration of the GPS Receiver, step 1

| Table 32 | Options of menu Set Rows ............................................................................ | 36 |
| Table 33 | Options of menu Set Rows ............................................................................ | 37 |
| Table 34 | Profibus Protocol PLC -> PDS ......................................................................... | 45 |
| Table 35 | Profibus Protocol PDS -> PLC ......................................................................... | 46 |
| Table 36 | Technical Data G_61430-A ............................................................................. | 48 |
11 Handbook Guidelines

At the time this manual was printed, the following symbols and marks were used in all Göttin KG documentations:

- For security advices, the following symbols stand for different degrees of danger and importance:

  NOTE!

  ATTENTION!

  WARNING!

- Further information or advices are indicated as follows:

  TIP!

  - Program texts and variables are indicated through the use of the Script Courier.

  - Whenever the pressing of letter keys is required for program entries, the required letter keys are indicated as such (for any programs of Göttin KG small and capital letters are equally valid).

  - Sections, drawings and tables are subsequential numbers throughout the complete document. In addition, each documents includes a list of contents showing the page numbers following the front. If a document exceeds 10 pages, it also has a drawings list and a list of tables on the last few pages. If required, in case a document is correspondingly long and complex, a index is added in the back.

  - Each document shows a small table including meta information, such as developer, author, revision and date of issue, on the front page. The information regarding revision and date of issue are also included in the bottom line on each page of the document. This way it is possible to clear identify the source document for each bit of information.

  - Online version (PDF) and printed handbook are always generated from the same source. Due to the consequent use of Adobe FrameMaker for these documentations, it is possible to use the cross hints and content entries (including page numbers of the index) of the PDF file for automatical transfer to the corresponding content.
12 Copyright and Terms of Liability

12.1 Copyright

This manual is protected by copyright. All rights reserved. Violations are subject to pe- nal legislation of the Copyright.

12.2 Exclusion of Liability

Any information given is to be understood as system description only, but is not to be taken as guaranteed features. Any values are reference values. The product charac- teristics are only valid if the systems are used according to the description.

This instruction manual has been drawn up to the best of our knowledge. Installation, setup and operation of the device will be on the customer’s own risk. Liability for conse-quential defects is excluded. We reserve the right for changes encouraging technical improvements. We also reserve the right to change the contents of this manual without having to give notice to any third party.

12.3 Trade Marks and Company Names

Unless stated otherwise, the herein mentioned logos and product names are legally protected trade marks of Götting KG. All third party product or company names may be trade marks or registered trade marks of the corresponding companies.
